

THREATLENS

Threat Intelligence Correlation & Alert Prioritization

"Turning raw security logs into meaningful incidents"

TEAM THREAT MINDS

Team Lead: Tamanna Bhura | **Team Members:** Niksha Garnara · Keshvi Kapadia

Why Did We Build ThreatLens?

Security systems generate a large number of logs every day. Most are normal. The hard part is finding the few events that may actually indicate an attack.

Many Sources

Logs come from firewalls, endpoints, DNS, email, and more.

Mixed Activity

Normal and suspicious events arrive together.

Alert Overload

The same attack can create multiple separate alerts.

Hard to Prioritize

Analysts need to know which incident to check first.

- Our main idea: bring these events together and give more importance to suspicious and related activity.

Our Solution — ThreatLens

ThreatLens is a security monitoring dashboard. It collects raw security events, processes them, connects related events, and gives them a risk-based priority.

Multiple Log Sources

Firewall, EDR, DNS, Email, Windows, Proxy

Event Correlation

Connects related events into one incident

Risk Scoring

Severity and confidence combined into one score

MITRE ATT&CK Mapping

Links behavior to known attacker techniques

Where Does the Data Come From?

For our demo, we generate simulated security logs from multiple sources to show how ThreatLens handles different types of events.

Normal / Benign Events

- Successful login
- Normal DNS query
- Approved connection
- Normal web request
- File access

Suspicious Events

- Multiple failed logins
- Port scanning
- Phishing activity
- Malware detection
- Suspicious DNS / exfiltration
- Privilege escalation

How ThreatLens Works

Normal events remain visible as raw telemetry, while suspicious events go through further analysis and can become incidents.

How Do We Find a Bigger Picture?

One event may not be enough to identify an attack. ThreatLens checks whether different events are connected.

Events Are Connected By:

- Same source IP address
- Same user account
- Same endpoint machine
- Similar time window
- Related behavior patterns
- Shared indicators of compromise

📄 Instead of treating every alert separately, ThreatLens groups related activity together.

How Do We Decide Which Incident Needs Attention?

ThreatLens gives every detected incident a risk score. The score helps us arrange incidents according to severity and available evidence.

Example Incident

Authentication Failure from 10.0.0.42

- Risk Score: 100
- Priority: **CRITICAL**
- Confidence: 100%
- Status: OPEN

Priority Levels

Critical

High

Medium

Low

Adding MITRE ATT&CK Context

After detecting suspicious activity, ThreatLens connects it to MITRE ATT&CK techniques. This gives analysts a standard name for the attacker behavior and makes investigation easier.

Example Techniques in Our Demo

T1046

Network Service
Scanning

T1059

Command & Scripting
Interpreter

T1110

Brute Force

T1078

Valid Accounts

T1074

Data Staged

Why It Helps

- Gives a standard name to attacker behavior
- Helps analysts understand what happened
- Makes investigation easier
- Provides additional context to an alert

📄 These techniques are shown as part of the demo incident data.

What Does the Analyst See?

The dashboard gives us both the raw events and the important incidents, so we can understand why an alert was generated.

Dashboard Overview

Incident Table Columns

ID · Title · Risk · Priority · Confidence · Status · MITRE Techniques

Live Raw Telemetry

Timestamp · Source · Event Type · Severity · Source IP · Destination · Status

Total Alerts

Total Incidents

Critical / High

Genuine Threats

False Positives

How the System Is Connected

Main idea: Different sources → one common view → easier investigation.

What We Built

- Multi-source security telemetry
- Normal and suspicious event handling
- Event processing and correlation
- Risk-based prioritization
- MITRE ATT&CK context
- Incident dashboard

ThreatLens helps us move from a large number of raw security events to a smaller set of meaningful incidents that can be investigated.

Thank You — Team Threat Minds
